(a)
price of 30 yr: 0.07–0.32 K per e-fold
10^4 yr ceiling:
arrows = lower bounds
acetate dial, f = 0
acetate dial, f = 0.5
habitat spread, d = 10^{-4} yr^{-1}
habitat spread, d = 10^{-3} yr^{-1}
30 yr
exact, cooling branch (36)
exact, unstable at τ = 0 (6)
on/off graded, lower bound (42)
resolved habitats, lower bound (71)
resolved habitats, finite (9)
Critical response time τ_c (yr)
$S = 0$
Local sensitivity |S| (K per e-fold of supply)
(b)
$S = -1.88$ K, $\tau_c > 10^4$ yr
exact: $S = 0$
$S = -0.28$ K
$\tau_c = 30$ yr
local tangents (derivatives),
not finite responses;
acetate dial, f = 0
Surface temperature T^* (K)
Change in log supply, $\ln(\Phi/\Phi_{ref})$
